NOTE.—The great majority of females engaged in rural occupations are employed in conjunction with domestic duties, very few being returned as working for wages. Since 1919 a more careful collection has been made of the number of females engaged in rural pursuits, and it would appear that previously about 12,000 females were included each year (e.g., wives of the proprietors) who were engaged wholly in domestic duties. The number of females quoted in the above table for years prior to 1920 represents, therefore, the number as returned, less 12,000.

## No. 53.—New South Wales Wheat Harvest, 1929-30.

The figures were compiled from returns made after the crops had been harvested, by each of the 15,733 wheat growers of the State.

The area sown for grain was 3,902,200 acres, including 463,000 acres which failed entirely, and the grain harvested amounted to 11,316,000 bags, equivalent to 33,948,000 bushels, or an average of 8.7 bushels per acre.

The area sown for hay was 375,100 acres, including 25,200 acres which failed, and the production of hay was 305,710 tons or an average of 0.81 tons per acre.

The area fed-off profitably—that is, with a green food value of 15s. or more per acre, was 57,700 acres; the area fed-off with a green food value of less than 15s. per acre has been included with the area which failed entirely. The total area sown with wheat was 4,335,000 acres.

During the early part of the season crop forecasts were, on account of unfavourable conditions, placed as low as 20 million bushels. Subsequent widespread rains, however, induced new growth in the crops, and the condition of the late crops appeared to indicate a good harvest. An estimate based on the returns from growers in January indicated a harvest of 35,844,000 bushels. The actual harvest showed that the crops were deceptive and the result was 1,896,000 bushels, or 5.5 per cent. below the estimate.

The crop was 30 per cent. below the average yield of the preceding ten years. The highest yield was obtained in the Northern Tableland, 20.0 bushels per acre; the Southern Tableland produced 17.3 bushels per acre; the North Western Slopes 15.5 bushels per acre, and the North Central Plain 13.1 bushels per acre. The Central Tableland and South Western Slope each produced 9.6 bushels per acre; the Riverina 9 bushels per acre; the Central Plain 5.5, and the Central Western Slope 4.8 bushels per acre.

Of the total area harvested for grain, including the area which failed entirely, 190,800 acres were sown on new land, 1,638,700 acres on fallowed land, and the balance, 2,072,700 acres, on stubble; the respective productions of grain were 5.1 bushels, 10.8 bushels, and 7.3 bushels per acre.

The following table shows the actual results of the harvest in the principal divisions of the State:—
